Looped models: the computed frontier advances loop by loop
looped r=2 (persistence 0.86 within its own loops, 0.70 over 16)
looped r=4 (persistence 0.88 within its own loops, 0.89 over 16)
looped r=8 (persistence 0.96 within its own loops, 0.96 over 16)
random loop count (1-8) (persistence 0.85 within its own loops, 0.85 over 16)
step-matched loops (= d) (persistence 0.92 within its own loops, 0.04 over 16)
one step per loop
first loop at which x_j is decodable (>= 0.5)
step j

Dense models: late, and absent in some seeds
dense 20 layers
dense 36 layers
first layer at which x_j is decodable (>= 0.5)
step j
